

Problem 1:

Servlet Login Application Without Database Using Edit+

Step-1:

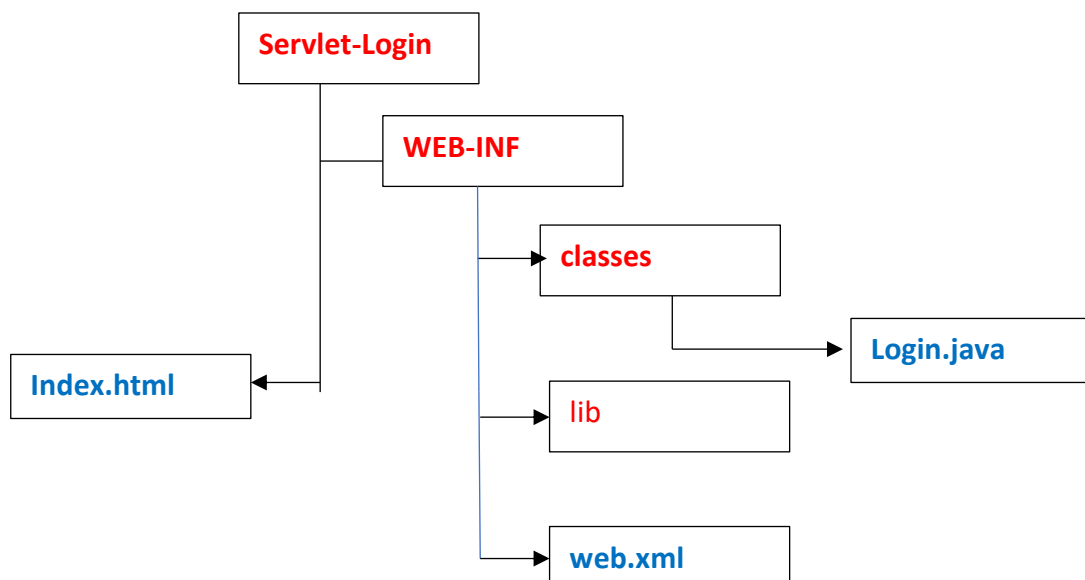

Create One Folder as “Servlet-Login” inside the tomcat / webapps folder where to install the tomcat server that’s your matter.

G:\Tomcat 9.0\webapps\Servlet-Login.

Step-2:

After create “Servlet-Login” to create directory structure of servlet application like this. Directory structure also known as folders and some file.

This is the rule of normal servlet application.

In this directory structure I'm create One "WEB-INF" and two files inside the "Servlet-Login"

Name as [index.html](#),

and also create two more folders inside the "WEB-INF" folder "classes" and "lib" and one file name as [web.xml](#)

and finally create one file name as [Login.java](#) inside the "classes" folder.

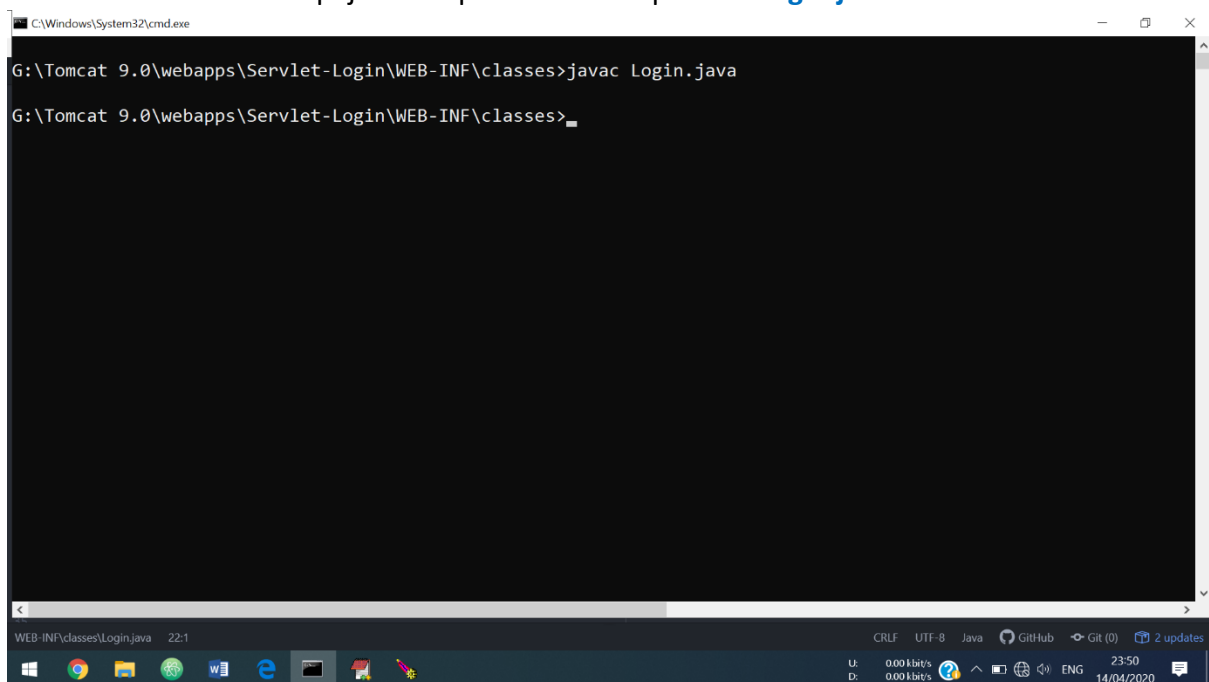

We know that which type code to write in the [index.html](#) and [Login.java](#)

If not understand which type code to write then comment me.

I'm also write the all necessary code for the file.

Step-3:

First to set the servlet-api.jar class path then Compile the [Login.java](#) file as

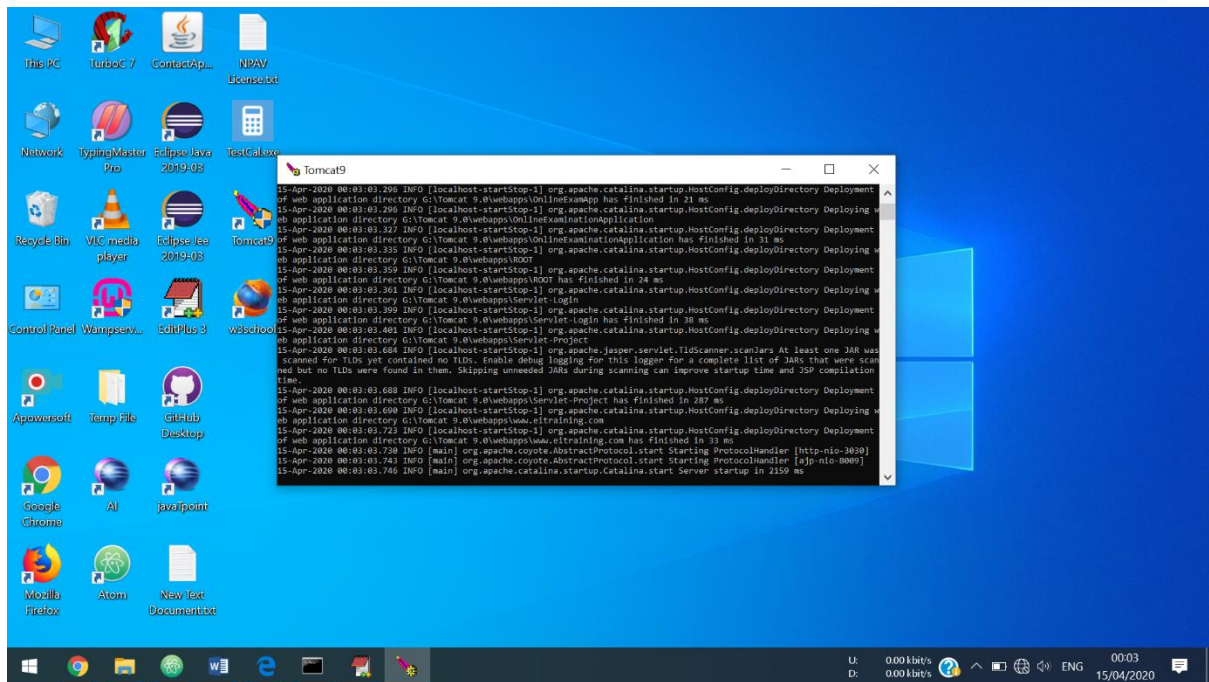

```
C:\Windows\System32\cmd.exe
G:\Tomcat 9.0\webapps\Servlet-Login\WEB-INF\classes>javac Login.java
G:\Tomcat 9.0\webapps\Servlet-Login\WEB-INF\classes>
```

The screenshot shows a Windows command prompt window with the title bar "C:\Windows\System32\cmd.exe". The command prompt is open at the directory "G:\Tomcat 9.0\webapps\Servlet-Login\WEB-INF\classes". The user has entered the command "javac Login.java" and pressed Enter. The prompt is now waiting for the next command. The Windows taskbar is visible at the bottom, showing various application icons and the system clock indicating 23:50 on 14/04/2020.

Step-3:

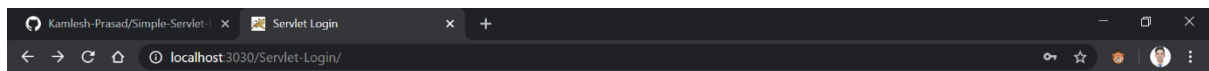

Start the server

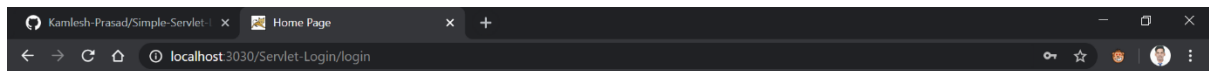

After successfully server started then access the dynamic web application by using browser

Type the URL : <http://localhost:3030/> see the tomcat homepage opened .

Click the **App Manager** and find the your project “**Login-Servlet**” and clicked it.
